

## The Greatest Dream of My Life

By: Brandon Kim

The greatest dream of my life is to push computer science to its limits and beyond. I want to study to be a computer programmer so that I can design software, AI, and robots that will make the world a better place. When I was 5 years old, I read my first book about robots and I was immediately fascinated. There was one robot that could help around the house, for example, it could sweep the floor, do the dishes, and it could even give you snacks or the T.V. remote. Of course, I wanted it, anybody would, but I was also curious about how it worked. I also wanted to build one of my own. A robot that could change humanity for the better.

Imagine a world with robots doing everything for you. Robot firefighters will take care of fires easily by taking out the source of the fire. Humanity is not perfect all the time right? What about robot surgeons? The robots could make precise cuts, and the patients would be fine 100% of the time. It means almost no patient will ever die because of surgery. Also, robots working jobs can work 24/7/365 and not get paid. Which means more work, so more money.

Some people might worry about singularity, an event where robots take over the world. But don't worry, humans will work alongside robots. Also, the singularity will definitely not happen 100%. Plus, there are the 3 rules for robots. The first rule is that robots can not hurt humans. The second rule is that robots must obey every command a human gave it, except for the commands that hurt people. The third and last rule is that robots have to protect themselves, but not in a way that breaks the first or second rule.

Recently, there have been multiple breakthroughs in the world of computer science and AI, such as a computer recognizing different hand gestures. This could allow people who cannot move their arms very well to access the internet on their own now. How about we go even further and make robots that could access computers and technology for people with impairments.

**My dream is to create a world where people are living easier and more comfortably because robots are always around. I want to design robots that make life better and inspire other inventors to do the same thing. I also want to go down in history as one of the greatest inventors known to humankind and robotkind.**
